Lesson Planning

Complete Lesson Plan Book

Class: I.Com · Class 11

Subject: Economics

Medium: English

Academic Year 2026-27

This book is prepared as a teaching guide for teachers.

Table of Contents

Unit 1: Demand and Supply: How Market Price is Set

DM

Unit 1: Demand and Supply: How Market Price is Set

Learning Objectives

• Students will draw demand and supply curves and find the equilibrium price.

• Students will predict how a shift in demand or supply changes price.

• Students will explain market price with a real daily-life example.

Key Concepts

• Demand falls as price rises, while supply rises as price rises.

• The demand curve slopes downwards and the supply curve slopes upwards.

• Equilibrium price is where quantity demanded equals quantity supplied.

• A shift in demand or supply moves the equilibrium price and quantity.

Teaching Methodology (Step by Step)

1. Open a classroom market: offer notebooks at three prices and count how many students would buy.
2. Plot the results as a demand curve, then add a supply curve from the seller's side.
3. Mark the point where the two curves cross and name it the equilibrium price.
4. Shift demand to the right and ask the class to find the new equilibrium.
5. Shift supply to the left and repeat the prediction exercise.
6. Close with the mango-season example: why the same fruit costs less in summer.

Classroom Activities

• Market stall role play: buyers and sellers agree a price for notebooks at different price levels.

• Curve shift game: groups predict the new price when demand rises but supply stays the same.

• Price hunt: students note the price of one common item and guess whether demand or supply moved it.

Assessment Questions

1. Draw a demand curve and a supply curve and mark the equilibrium price.
2. What happens to price when demand rises and supply stays the same?
3. Give one real example of a supply fall raising the price of a good.

Homework

• Draw the market for mangoes in summer and in winter, and explain the price difference.

• Write two examples from daily life: one demand shift and one supply shift.

Time Allocation

40 minutes
