Lesson Planning

Complete Lesson Plan Book

Class: Class 6

Subject: Science

Medium: English

Academic Year 2026-27

This book is prepared as a teaching guide for teachers.

Table of Contents

Unit 1: States of Matter: Solids, Liquids and Gases

DM

Unit 1: States of Matter: Solids, Liquids and Gases

Learning Objectives

• Students will name the three states of matter and give one everyday example of each.

• Students will describe how particles are arranged and move in a solid, a liquid and a gas.

• Students will explain why a liquid takes the shape of its container while a solid keeps its own shape.

Key Concepts

• Everything around us is matter, and matter is made of tiny particles.

• In a solid the particles are packed tightly and only vibrate in place, so a solid keeps its shape.

• In a liquid the particles can slide past each other, so a liquid flows and takes the shape of its container.

• In a gas the particles move freely and spread out, so a gas fills the whole space available.

Teaching Methodology (Step by Step)

1. Show a stone, a glass of water and a blown balloon, and ask the class how the three feel different.
2. Draw the particle arrangement for each state on the board and compare spacing and movement.
3. Pour water from a jug into a bowl and a bottle so students see the same liquid change shape.
4. Ask why the balloon keeps its round shape only while it is tied, linking the idea to gas particles pushing outwards.
5. Students sort a list of objects into solid, liquid and gas in pairs and defend one choice each.

Classroom Activities

• Sorting game: picture cards of ice, milk, steam, wood and juice are placed under the correct state heading.

• Act it out: groups pretend to be particles in a solid, then a liquid, then a gas, and freeze on command.

• Shape test: students predict and then check what happens when the same water is poured into three different containers.

Assessment Questions

1. Name one solid, one liquid and one gas found in a kitchen.
2. Why does a liquid not keep its own shape?
3. A gas is let out of a small bottle in a big room. Where will its particles go, and why?

Homework

• Find five objects at home, write their state of matter, and explain your answer in one line each.

• Draw the three particle arrangements and label which one can be compressed most easily, with a reason.

Time Allocation

40 minutes
